

Extensions to **Place** – “Where” in common

If you do not have a geocoder or want to be explicit:

- schema:address

You can submit it as text in `content`

- All the official ISO Codes for Search

Things like OLC can be calculated by the combi latitude/longitude/radius/accuracy

Note:

mobilizon uses schema:address as a direct property for

- location

redaktor has an extensive context for Place and is extending it with wikidata and OSM.

This is self declaring and has benefits:

- Common Knowledge (facts)
 - multilanguage labels
 - multilanguage descriptions / "summary"
 - multilanguage full text / "content" (wikitravel, wikivoyage, wikipedia, linked wikis)
 - Qualified statements and relations
- for our Atlas of 1.9 million organized Place ...
